PHYSICIAN VERIFICATION

REAL-TIME ACCESS TO PHYSICIAN DATA

Since provider information is constantly changing, we offer a solution for our clients that offers real-time access to an up-to-date provider database. Redi-Data Physician Verification provides customers with system-to-system access for query authentication and is a cost effective solution used for compliance purposes, sampling, sales force integration and much more.
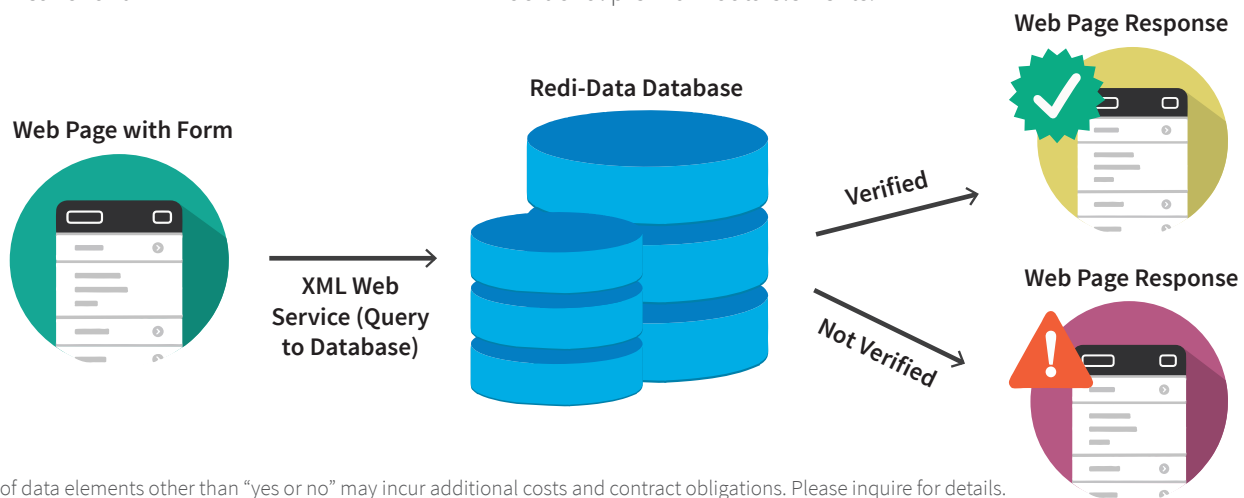

How it Works

Redi-Data Physician Verification is a web service providing full prescriber database access without requiring customers to load and maintain the database internally.

The API allows the client's application to create an XML request that is answered by a host server without human intervention or manual user interface. It can also provide customers with either a "yes" or "no" flag or send specific data elements* all accomplished within a sub second response time.

The **Redi-Data Physician Verifier** solution can be custom tailored to meet your specific needs or specific data requirements and can include:

- Physician name
- NPI or state license number
- Address
- Phone
- Year of birth

- Gender
- Year of medical school graduation
- DEA number
- Hospital affiliation
- Additional premium data elements.**
